Abstract. In this note, we provide the first 22-step collisions for SHA-256 and SHA-512. Detailed technique of generating these collisions will be provided in the next revision of this note.

1 Introduction

SHA-256 and SHA-512 are the next generation hash functions designed and standardized by NIST in 2002 [1]. In this note, we provide message pairs colliding for 22-step SHA-256 and 22-step SHA-512. This is the first attack on 22-step SHA-2 family. The success probability of our attack is around 2^{-5} in average case and around 2^{-9} in the worst case. Both these probability figures are experimental. Details of the attack will be provided in the next revision of this note.

2 Message pairs colliding for 22-step SHA-2

Table 1. Colliding message pair for 22-step SHA-256 with standard IV. These message pairs follow the differential path given in Table 3.

Table 3. Differential path followed by the message pairs given in Table 1. The differential path for the message pair of Table 2 is different but similar looking. If the register values for the first message W_1 are denoted by $\{a_i, b_i, \dots, h_i\}$ and those for the second message W_2 are denoted by $\{a'_i, b'_i, \dots, h'_i\}$, then δX stands for $X' - X$, where X could be any register value. The 22 steps are indexed from 0 to 21.
